How can I test Meteor client-side code without using a real server? I'm using mrt with a local development server, but it's extremely slow to run tests that use local data. A: Meteor is sandboxed. This means that any changes to the code will not persist in the server if you re-deploy or if you use the meteor reset command. Your first step should be to clean everything up and simply run meteor reset. This will wipe out all of the code in your code directory and start you over. You could then add Meteor.startup() at the top of your files to get your code running again. If you really want to have a sandbox test environment, you can use the meteor test-server package.
